

# Simplifying GWT RPC with Open Source GWT-Tools RPC Service (GWT 2.4 Version)

Originals of Slides and Source Code for Examples:

<http://courses.coreservlets.com/Course-Materials/gwt.html>

**Customized Java EE Training:** <http://courses.coreservlets.com/>

GWT, Java, JSF 2, PrimeFaces, Servlets, JSP, Ajax, jQuery, Spring, Hibernate, RESTful Web Services, Hadoop, Android.  
Developed and taught by well-known author and developer. At public venues or onsite at *your* location.

**For live Ajax and GWT training, please see  
courses at <http://courses.coreservlets.com/>.**

**Taught by the author of *Core Servlets and JSP*, *More Servlets and JSP*, and this tutorial. Available at public venues, or customized versions can be held on-site at your organization.**

- Courses developed and taught by Marty Hall
    - JSF 2, PrimeFaces, servlets/JSP, Ajax, jQuery, Android development, Java 6 or 7 programming, custom mix of topics
    - Ajax courses can concentrate on 1 library (jQuery, Prototype/Scriptaculous, Ext-JS, Dojo, etc.) or survey several
  - Courses developed and taught by coreservlets.com experts (edited by Marty)
    - Spring, Hibernate/JPA, EJB3, GWT, Hadoop, SOAP-based and RESTful Web Services
- Contact [hall@coreservlets.com](mailto:hall@coreservlets.com) for details

## Topics in This Section

- **Quick GWT RPC review**
- **Motivation**
- **Advantages/Disadvantages**
- **Basic steps**
- **Example**
- **More examples**
- **Alternatives**

4

## RPC Review: Big Idea

- **Write regular methods on server; don't write servlet methods**
  - Methods take arbitrary arguments
    - Not `HttpServletRequest` and `HttpServletResponse`
  - Methods return arbitrary results
    - Strings, arrays, lists, custom classes, etc.
- **Call methods directly from client; don't make explicit HTTP requests**
  - Call server methods almost as though they were local
  - Pass arbitrary arguments and get arbitrary results
    - Custom form of serialization handles all the parsing

5

## GWT-RPC Development Steps

- **Define main data service interface**
  - Implement RemoteService interface
  - Define regular methods without explicit HTTP
  - Use `@RemoteServiceRelativePath` to point at servlet
- **Define callback version of data service interface**
  - If main interface is `FooService`, define `FooServiceAsync`
- **Make data service servlet**
  - Extend `RemoteServiceServlet`, implement service interface
  - Supply url-pattern in `web.xml` that matches relative path
- **Create service proxy**
  - Call `GWT.create(YourServiceInterfaceName.class)`
- **Define client-side callback objects**
  - With `onSuccess` and `onFailure`

6

## Motivation behind RPC Service

- **Regular GWT RPC has too many configuration steps every time you need to define a new set of methods**
- **Hard to integrate central exception handling**
  - E.g., if a particular type of exception occurs, I want to always navigate to some view
  - Without central exception handling, you have to hard code this in *every single* `AsyncCallback.onFailure`
- **Any changes to existing methods are somewhat cumbersome**
  - Always have to remember to update url-pattern, etc.
- **I want to set it up once and forget it!**

7

## **Solution: Command Design Pattern**

- **Command design pattern fits perfectly to the Request/Response paradigm**
  - In the end, this is what GWT RPC is: request/response
- **Issue a server request for data like a command**
- **Server inspects the command type and dispatches it to the appropriate command handler**
- **Handler executes command and returns a Response**

8

## **RPC Service: Summary of Features**

- **Automatic discovery of handlers**
- **Automatic discovery and autowiring of Spring Framework enabled handlers**
  - E.g., allows autowiring of Data Access Objects (DAOs)
- **Multiple request commands can share a response**
  - E.g., create new item and update item both will return new/updated item data
- **Default implementation of AsyncCallback**
  - With a way to provide an application-wide exception handler
- **Annotation-based configuration**
- **Only one GWT RPC URL to map**
  - Everything goes through that central URL

9

## Configuration Steps

- **Download rpc-service-xxx.jar from:**  
<http://code.google.com/p/gwt-tools/downloads/list>
- **Place JAR in the WEB-INF/lib directory**
  - Depending on the type of Eclipse project you have, you might have to tell Eclipse about the JAR (through project properties – Java Build Path)
- **In web.xml, configure RPC Service servlet:**

```
<servlet>
  <servlet-name>rpc-service-servlet</servlet-name>
  <servlet-class>
    org.tbiq.gwt.tools.rpcservice.server.RpcServiceServlet
  </servlet-class>
  <load-on-startup>1</load-on-startup>
</servlet>
<servlet-mapping>
  <servlet-name>rpc-service-servlet</servlet-name>
  <url-pattern>/contacts/rpc-service</url-pattern>
</servlet-mapping>
```

10

## Configuration Steps (continued)

- **In web.xml, configure auto-discovery of RPC request handlers**
  - Two choices: package-based or Spring-based discovery
- **Package-based discovery example:**

```
<listener>
  <listener-class>
    org...discovery.DefaultRpcRequestRegistryInitializationListener
  </listener-class>
</listener>
<context-param>
  <param-name>packagesToScan</param-name>
  <param-value>
    com.google.gwt.sample.contacts.server.rpc
  </param-value>
</context-param>
```

Look for RPC request handlers in this package (or under) and register them.

11

## Configuration Steps (continued)

- In web.xml, configure auto-discovery of RPC request handlers
  - Two choices: package-based or Spring-based discovery
- **Spring-based discovery example:**

```
<listener>
  <listener-class>
    org.springframework.web.context.ContextLoaderListener
  </listener-class>
</listener>
<context-param>
<param-name>contextConfigLocation</param-name>
  <param-value>classpath:/applicationContext.xml</param-value>
</context-param>
<listener>
  <listener-class>
    org...discovery.SpringRpcRequestRegistryInitializationListener
  </listener-class>
</listener>
```

Regular Spring Framework configuration for web modules.

RPC Service listener must be configured after the Spring Framework listener in web.xml.

12

## Using: Basic Steps

- **Create response class (in .client package)**
  - Implements RpcResponse
- **Create request class (in .client package)**
  - Implements RpcRequest<BlahResponse>
  - Make sure request/response classes have zero arg constructor
    - Interfaces RpcRequest, RpcResponse already Serializable
- **Create handler class (outside .client pkg)**
  - Implements RpcRequestHandler
  - Implement its execute method
- **Setup and make the RPC call from client**

13

## Example: (retrieve contact) GetContactResponse.java

```
public class GetContactResponse implements RpcResponse
{
    private Contact contact; ← Contact returned from server.

    public GetContactResponse() {} ← Required Zero-arg constructor.

    public GetContactResponse(Contact contact) {
        this.contact = contact;
    }

    public Contact getContact() {
        return contact;
    }

    public void setContact(Contact contact) {
        this.contact = contact;
    }
}
```

14

## Example: (retrieve contact) GetContactRequest.java

```
public class GetContactRequest
    implements RpcRequest<GetContactResponse> {
    private String contactId;

    public GetContactRequest() {}

    public GetContactRequest(String contactId) {
        this.contactId = contactId;
    }

    public String getContactId() {
        return contactId;
    }

    public void setContactId(String contactId) {
        this.contactId = contactId;
    }
}
```

Request is compile-time tied to the response!

ID of contact to retrieve from the server.

15

## Example: (retrieve contact) In SomePresenter.java

```
DefaultRpcAsyncCallback callback = new DefaultRpcAsyncCallback(  
    new DefaultApplicationExceptionHandler())  
{  
    @Override  
    protected void handleResponse(RpcResponse response)  
    {  
        // Cast response to GetContactResponse  
        //(because of GWT compiler generics bug)  
        GetContactResponse getContactResponse =  
            (GetContactResponse) response;  
        contact = getContactResponse.getContact();  
  
        // Display retrieved contact  
        someTextWidget.setValue(contact.getFirstName());  
        someTextWidget.setValue(contact.getLastName());  
        someTextWidget.setValue(contact.getEmailAddress());  
    }  
};  
  
rpcService.execute(new GetContactRequest(id), callback);
```

← Pops up an alert with the exception.getMessage().

16

## Example: (retrieve contact) GetContactRequestHandler.java

```
@RpcHandler  
public class GetContactRequestHandler implements  
    RpcRequestHandler<GetContactRequest, GetContactResponse> {  
  
    public GetContactResponse execute(GetContactRequest rpcRequest,  
        ServletExecutionContext context)  
  
        throws RpcServiceException {  
        // Retrieve contact with the given ID  
        ContactsStore store = ContactsStore.getContactsStore();  
        String contactId = rpcRequest.getContactId() + "";  
        Contact contact = store.getContact(contactId);  
  
        // Wrap contact into an RPC response object and return response  
        GetContactResponse rpcResponse =  
            new GetContactResponse(contact);  
        return rpcResponse;  
    }  
  
    public Class<GetContactRequest> getCompatibleRpcRequestType() {  
        return GetContactRequest.class;  
    }  
}
```

17

## Fully Working Examples

- **Check out all the source code with 3 example apps at:**  
<http://code.google.com/p/gwt-tools/source/checkout>
- **Three example apps:**
  - Original Contacts app Google provide as an example, but mavenized
  - Same as above plus using place-service
    - History handler framework
      - Use only if stuck with GWT < 2.1
  - Same as above plus using RPC Service with package autodiscovery of RPC Handlers
  - Same as above plus using RPC Service Spring-enabled autodiscovery of RPC Handlers

18

## Alternatives

- **gwt-dispatch**
  - <http://code.google.com/p/gwt-dispatch/>
  - Widely used
  - Nice developer forum
- **GWT RequestFactory**
  - Much more advanced but not as straightforward to use
  - Has many more features like automatically creating EntityProxy beans to reuse EJB 3.0 Entity beans directly in GWT client code
- **Google for other open source command-pattern request/response GWT RPC frameworks**

19

# Wrap-Up

**Customized Java EE Training: <http://courses.coreservlets.com/>**

GWT, Java, JSF 2, PrimeFaces, Servlets, JSP, Ajax, jQuery, Spring, Hibernate, RESTful Web Services, Hadoop, Android.  
Developed and taught by well-known author and developer. At public venues or onsite at *your* location.

# Questions?

[JSF 2, PrimeFaces, Java 7, Ajax, jQuery, Hadoop, RESTful Web Services, Android, Spring, Hibernate, Servlets, JSP, GWT, and other Java EE training.](#)
