

Exercises: Cell Widgets

- 1.** Make a `List<String>` of a few simple color names (red, orange, yellow, etc.). Use `CellList` to display these colors in a list on the page.
- 2.** Add behavior so that clicking on one of the colors changes a section of the page to be that color. (Hint: for actually showing the selected color, adapt the very similar code from your exercises on basic Panels).
- 3.** Make a `CellList` that says Entry 0, Entry 1, Entry 2, and Entry 3. Use the `DataProvider` approach.
- 4.** Add a button that, when pressed, adds a new entry to the previous `CellList` (Entry 4, Entry 5, etc.)
