

Scriptaculous I

- 1.** Make a JavaScript array that contains a few city names beginning with A and B. (See <http://www.usatoday.com/weather/resources/climate/wusaclim.htm> for a short list.) Make a local autocompleter that lets you enter the name of a city. For extra “credit”, send the city name to Google when you press a pushbutton.
- 2.** Repeat the process, but use an Ajax autocompleter where the list of cities is on the server. Again, for extra “credit”, send the city name to Google when you press a pushbutton.
- 3.** Collect a customer ID (with autocompletion). When you press a pushbutton, display that person’s id, first name, last name, and balance. You can just use my Customer and CustomerUtils classes on the server.
