

JavaScript: Functions

Slides © 2016 Marty Hall, hall@coreservlets.com

For additional materials, please see <http://www.coreservlets.com/>. The JavaScript tutorial section contains complete source code for all examples in the entire tutorial series, plus exercises and exercise solutions for each topic.

For customized training related to JavaScript or Java, email hall@coreservlets.com
Marty is also available for consulting and development support

Taught by lead author of *Core Servlets & JSP*,
co-author of *Core JSF* (4th Ed), and this tutorial.

Available at public venues, or
custom versions can be held on-site at your organization.

- **Courses developed and taught by Marty Hall**
 - JavaScript, jQuery, Ext JS, JSF 2.3, PrimeFaces, Java 8 programming, Spring Framework, Spring MVC, Android, GWT, custom mix of topics
 - Courses available in any state or country.
 - Maryland/DC companies can also choose afternoon/evening courses.
- **Courses developed and taught by coreservlets.com experts (edited by Marty)**
 - Hadoop, Hibernate/JPA, HTML5, RESTful Web Services

Contact hall@coreservlets.com for details

Topics in This Section

- Importance of functional programming
- Assigning functions to variables, arrays, and other data structures
- Passing functions to other functions
- Returning functions from functions
- Making anonymous functions
- Capturing local variables (making closures)
- Using the apply and call methods

4

coreservlets.com – custom onsite training

Intro

JavaScript has more in common with functional languages like Lisp or Scheme than with C or Java.
- JSON and YUI guru Douglas Crockford in article
JavaScript: The World's Most Misunderstood Programming Language

Slides © 2016 Marty Hall, hall@coreservlets.com

For additional materials, please see <http://www.coreservlets.com/>. The JavaScript tutorial section contains complete source code for all examples in the entire tutorial series, plus exercises and exercise solutions for each topic.

Getting Good at JavaScript

- **Experience with other languages can be an impediment here**
 - If you try to program JavaScript like Java 7 and earlier, you will *never* be good at JavaScript. Java 8 and later have functional programming capabilities, however.
 - Beginners or programmers from Ruby, Lisp, Scheme, Python, ML, Haskell, Clojure, Scala sometimes do better
- **Functional programming, not object-oriented programming, is key**
 - Functional programming is much more central to JavaScript programming than OOP is
 - Java programmers (at least prior to Java 8) find functional programming to be the single-hardest part of JavaScript to learn
- **OOP in JavaScript is radically different than in most languages**
 - So different in fact, that some argue that by some definitions of OOP, JavaScript does not have “real” OOP

6

Overview

- **You can have global functions**
 - Not just methods (functions as part of objects)
- **You don't declare return types or argument types**

```
function square(x) { return(x * x); }
```

 - You never say the input (x) or the output (x * x) are numbers
- **Functions are first-class datatypes**
 - You can pass functions around, store them in arrays, etc.
- **You can create anonymous functions**

```
function foo(...) { ... }  
var foo = function(...) { ... }
```

 - You can also have anonymous functions that capture local variables (closures)
 - This capability is critical to Ajax (discussed in the jQuery section)
- **Functions can have methods**
 - Just as strings and arrays can

7

Assigning Functions to Variables, Arrays, and Other Data Structures

Slides © 2016 Marty Hall, hall@coreservlets.com

For additional materials, please see <http://www.coreservlets.com/>. The JavaScript tutorial section contains complete source code for all examples in the entire tutorial series, plus exercises and exercise solutions for each topic.

Functions are First-Class Data Types

- **Can assign functions to variables**
- **Can put functions in arrays (or other data structures)**
- **Can pass functions to other functions**
- **Can return functions from functions**
- **Can create functions without assigning them to variables (anonymous functions)**
- **Can create functions that capture local variables (closures)**
- **Functions can have methods, just as strings and arrays can**

"It is Lisp in C's clothing."

- Douglas Crockford describing the JavaScript language in *JavaScript: The Good Parts*

Assigning to Variables

```
function square(x) {  
  return(x*x);  
}
```

```
square(5); → 25
```

```
var f = square; // Not square() or square(5)
```

```
f(10); → 100
```

10

Putting Functions in Data Structures

- **Arrays**

```
function square(x) { return(x*x); }  
var f = square;  
function double(x) { return(x*2); }  
var functs = [square, f, double];  
functs[1](5); → 25  
functs[2](5); → 10
```

- **Objects (object details covered later)**

```
var person = {  
  firstName: "Harry",  
  lastName: "Hacker",  
  favoriteFunction: square  
}  
person.favoriteFunction(5); → 25
```

11

Passing Functions to Other Functions

Slides © 2016 Marty Hall, hall@coreservlets.com

For additional materials, please see <http://www.coreservlets.com/>. The JavaScript tutorial section contains complete source code for all examples in the entire tutorial series, plus exercises and exercise solutions for each topic.

Functions are First-Class Data Types

- Can assign functions to variables
- Can put functions in arrays (or other data structures)
- **Can pass functions to other functions**
- Can return functions from functions
- Can create functions without assigning them to variables (anonymous functions)
- Can create functions that capture local variables (closures)
- Functions can have methods, just as strings and arrays can

Simple Examples

```
function applyToSeven(func) {
  return(func(7));
}
applyToSeven(square); → 49
applyToSeven(double); → 14
function applyTwice(func, value) {
  return(func(func(value)));
}
applyTwice(square, 5); → 625
function applyRepeatedly(func, value, numRepeats) {
  for(var i=0; i<numRepeats; i++) {
    value = func(value);
  }
  return(value);
}
applyRepeatedly(double, 5, 3); → 40
```

14

Review: Array Methods that Accept Functions

- **sort**

```
function difference(n1,n2) { return(n1-n2); }
function reverseDifference(n1,n2) { return(n2-n1); }
[1,3,5,4,2].sort(difference); → [1,2,3,4,5]
[1,3,5,4,2].sort(reverseDifference); → [5,4,3,2,1]
```

- **map**

```
[1,2,3,4,5].map(square); → [1,4,9,16,25]
```

- **filter**

```
function isEven(n) { return(n%2 == 0); }
[1,2,3,4,5].filter(isEven); → [2,4]
```

- **reduce**

```
function add(n1,n2) { return(n1 + n2); }
[1,2,3,4,5].reduce(add, 0); → 15
```

15

Applying the Array Methods

- **Goal**

- Pass in function and array of values. Apply function to each value. Sum the results.

- **Alternative 1 (doing it by hand)**

```
function arraySum1(func, values) {  
    var sum = 0;  
    for(var i=0; i<values.length; i++) {  
        sum = sum + func(values[i]);  
    }  
    return(sum);  
}
```

arraySum1(square, [1,2,3,4,5]); → 55

- **Alternative 2 (using array methods)**

```
function arraySum2(func, values) {  
    function add(n1,n2) { return(n1 + n2); }  
    return(values.map(func).reduce(add, 0));  
}
```

arraySum2(square, [1,2,3,4,5]); → 55

Returning Functions from Functions

Slides © 2016 Marty Hall, hall@coreservlets.com

For additional materials, please see <http://www.coreservlets.com/>. The JavaScript tutorial section contains complete source code for all examples in the entire tutorial series, plus exercises and exercise solutions for each topic.

Functions are First-Class Data Types

- Can assign functions to variables
- Can put functions in arrays (or other data structures)
- Can pass functions to other functions
- **Can return functions from functions**
- Can create functions without assigning them to variables (anonymous functions)
- Can create functions that capture local variables (closures)
- Functions can have methods, just as strings and arrays can

18

Example

```
function square(x) { return(x*x); }
function double(x) { return(x*2); }
function randomFunct() {
  if(Math.random() > 0.5) {
    return(square);
  } else {
    return(double)
  }
}
var ran = randomFunct();
ran(5) → 25 // Or, could be 10
ran(5) → 25 // Will always match value above
ran(5) → 25 // Will always match value above
ran = randomFunct();
ran(5) → 10 // Or, could be 25
```

19

Creating Anonymous Functions

Slides © 2016 Marty Hall, hall@coreservlets.com

For additional materials, please see <http://www.coreservlets.com/>. The JavaScript tutorial section contains complete source code for all examples in the entire tutorial series, plus exercises and exercise solutions for each topic.

Functions are First-Class Data Types

- Can assign functions to variables
- Can put functions in arrays (or other data structures)
- Can pass functions to other functions
- Can return functions from functions
- **Can create functions without assigning them to variables (anonymous functions)**
- Can create functions that capture local variables (closures)

Basics

- **Simple anonymous functions**

```
var square = function(x) { return(x * x); };
```

```
square(5); → 25
```

```
(function(x) { return(x * x); })(10) → 100
```

- **Equivalent constructs**

```
function square(x) {  
    return(x * x);  
}
```

```
var square = function(x) {  
    return(x * x);  
};
```

- The bottom one is actually widely used in real life so that you can define functions within namespaces as shown in the upcoming section on objects.

```
var namespace = {};
```

```
var namespace.functionName = function(...) { ... };
```

22

Problem with randomFunction Function

- **Example from previous section**

```
function square(x) { return(x*x); }
```

```
function double(x) { return(x*2); }
```

```
function randomFunc() {  
    if(Math.random() > 0.5) {  
        return(square);  
    } else {  
        return(double)  
    }  
}
```

- **Drawback: not self contained**

- Relies on square and double already being defined
- Changes in functionality if double and square are redefined

23

Redoing randomFunction

- **With local named functions**

```
function randomFunct2() {  
  function square(x) { return(x*x); }  
  function double(x) { return(x*2); }  
  if(Math.random() > 0.5) {  
    return(square);  
  } else {  
    return(double)  
  }  
}  
  
var f = randomFunct2();  
f(10); → 100 // Or maybe 20  
(randomFunct2()(10)); → 20 // Or maybe 100
```

24

Redoing randomFunction

- **With anonymous functions**

```
function randomFunct3() {  
  if(Math.random() > 0.5) {  
    return(function (x) { return(x*x); });  
  } else {  
    return(function (x) { return(x*2); })  
  }  
}  
  
var f = randomFunct3();  
f(10); → 100 // Or maybe 20  
(randomFunct3()(10)); → 20 // Or maybe 100
```

25

Capturing Local Variables (Making Closures)

Slides © 2016 Marty Hall, hall@coreservlets.com

For additional materials, please see <http://www.coreservlets.com/>. The JavaScript tutorial section contains complete source code for all examples in the entire tutorial series, plus exercises and exercise solutions for each topic.

Functions are First-Class Data Types

- Can assign functions to variables
- Can put functions in arrays (or other data structures)
- Can pass functions to other functions
- Can return functions from functions
- Can create functions without assigning them to variables (anonymous functions)
- **Can create functions that capture local variables (closures)**
- Functions can have methods, just as strings and arrays can

Function-Creating Function

- **With fixed value**

```
function makeTimes7Function() {  
    return(function(n) { return(n*7); });  
}  
var f = makeTimes7Function();  
f(5); → 35
```

- **With dynamic value**

```
function makeMultiplierFunction(m) {  
    return(function(n) { return(n*m); });  
}  
var test = 8;  
var f = makeMultiplierFunction(test);  
f(5); → 40  
test = 500;
```

28 f(5); → 40 // Not 2500. The closure has private copy of m (8)

The apply and call Methods

Slides © 2016 Marty Hall, hall@coreservlets.com

For additional materials, please see <http://www.coreservlets.com/>. The JavaScript tutorial section contains complete source code for all examples in the entire tutorial series, plus exercises and exercise solutions for each topic.

Functions are First-Class Data Types

- Can assign functions to variables
- Can put functions in arrays (or other data structures)
- Can pass functions to other functions
- Can return functions from functions
- Can create functions without assigning them to variables (anonymous functions)
- Can create functions that capture local variables (closures)
- **Functions can have methods, just as strings and arrays can**

30

The apply Method: Simple Use

- **Idea**
 - Lets you apply function to array of arguments instead of individual arguments.
 - apply is a method *of* functions!
 - `someFunction.apply(null, arrayOfArgs);`
 - See next slide for usage with an object instead of null for the first argument

- **Examples**

```
function hypotenuse(leg1, leg2) {  
    return(Math.sqrt(leg1*leg1 + leg2*leg2));  
}
```

```
hypotenuse(3, 4); → 5
```

```
var legs = [3, 4];
```

```
hypotenuse.apply(null, legs); → 5
```

```
Math.max.apply(null, [1, 3, 5, 7, 6, 4, 2]); → 7
```

31

The call and apply methods: Use with Objects

- **Idea**

- call

- Lets you call function on args, but sets “this” first.
 - Will make more sense once we cover objects, but the main idea is that “this” lets you access object properties. So, “call” treats a regular function like a method of the object.

- apply

- Same idea, but you supply arguments as array

- **Examples**

```
function fullName() {  
    return(this.firstName + " " + this.lastName);  
}  
fullName(); → "undefined undefined"  
var person = { firstName: "David", lastName: "Flanagan" };  
fullName.call(person); → "David Flanagan"
```

32

coreservlets.com – custom onsite training

Wrap-up

Slides © 2016 Marty Hall, hall@coreservlets.com

For additional materials, please see <http://www.coreservlets.com/>. The JavaScript tutorial section contains complete source code for all examples in the entire tutorial series, plus exercises and exercise solutions for each topic.

Summary

- **Can assign functions to variables**
`var f = square;`
- **Can put functions in arrays (or other data structures)**
`var functs = [square, f, double];`
- **Can pass functions to other functions**
`callIt(square, 7);`
- **Can return functions from functions**
`return(square);`
- **Can create functions without assigning them to variables**
`(function(x) { return(x*x); })(8); → 64`
- **Can create functions that capture local variables (closures)**
`var f = makeMultiplierFunction(5);`
- **Can use apply if arguments are already in array**
`Math.max.apply(null, [1, 3, 5, 7, 6, 4, 2]); → 7`
