Custom Components

These exercises are long!

1. Make a component that displays a random number between 0 and 1. What happens if you display it with rendered='false'?

2. Make a component that displays a random number between 0 and some specified range. Verify that you can use the JSF expression language to designate the range.

3. Make a component that contains two textfields and a submit button. Display the sum of the two fields. (Hint: have the sum be the “submitted value”).
