

Exercises: JSF 2.2 Faces Flow Part 2

Continue using the same project as with the exercises for Faces Flow Part 1.

1. Copy the first-flow folder, and name the copy java-flow. Define the flow using Java, so that the pages, navigation, and bean work within this flow. However, be sure that
 - The starting page within the java-flow folder is *not* named java-flow.xhtml.
 - The outcome used by index.jsf to trigger the flow is *not* “java-flow”. Similarly, the name of the flow as supplied to the @FlowScoped annotation is *not* “java-flow”.
 - The outcomes used within the flow to go to page1.xhtml, page2.xhtml, and page3.xhtml are *not* “page1”, “page2”, and “page3”.
 - The return page is *not* named java-flow-return.xhtml.

Major hint: copy SimpleFlowBuilder.java from my flows project, get rid of the .switchNode entry, and adapt the rest of it accordingly.
