

# Exercises: Using Spring with JSF 2.0

- 1.** Make an application that accepts a potential dollar amount. If the richest customer has a higher balance than this, say “Yes, we have a customer even richer than that”, and print out that richest customer’s first name, last name, and balance. If the richest customer has a lower balance, say, “No, we don’t have anyone that rich”. Test *without* using Spring by hardcoding the reference to the richest customer into your backing bean.
- 2.** Have Spring define the richest customer as a Spring bean. Use `faces-config.xml` and `managed-property` to insert that customer into your backing bean.
- 3.** Get rid of *all* bean-related entries in `faces-config`, and do everything (creating the richest customer and injecting it into the backing bean) from `applicationContext.xml`.
