

Exercises: PrimeFaces Charts

Make a new PrimeFaces project.

1. Make a pie chart displaying the breakdown of sales at the Grand Traverse Pie Company: something like the following. Hint: use `style` or `styleClass` to control the width and height of the chart.

2. Make a line chart displaying sales of various types of foods in the first five days at a new store: something like the following. Hint: define the `LineChartSeries` right inside the class, instead of in a separate class. The lecture examples used a separate class only because the same series was used in multiple examples.

3. Make a bar chart to display the same information: something like the following. *Major* hint: copy your Java class from problem 2, change all occurrences of “`LineChartModel`” to “`BarChartModel`”, and all occurrences of “`LineChartSeries`” to “`BarChartSeries`”, and you need to make *no* other changes to the Java code.
