

# Exercises: PrimeFaces Data Tables

Make a new PrimeFaces project and define a Person class that represents a first name, last name, email address, and age. Make a managed bean that has a method that returns a List (not array!) of Persons.

1. Make a table that shows the people
2. Make a similar table, but with column headings and an overall table heading
3. Make a similar table, but where you can sort by last name or age. Remember that you must enclose the table in h:form.
4. Make a similar table to #2 (headings but not sorting), but where only four people at a time are shown in the table, and the user can page through the total results.
