

# PrimeFaces: String Input (Part II)

1. Make a new PrimeFaces project.

Have the user enter a username and a password. Neither can be empty. Give feedback on the password strength. Display both in the confirmation page.

2. Add two color choosers: one to affect the foreground color in which the username will be displayed on the confirmation page, and one to affect the color in which the password will be displayed.
3. Add a captcha to prevent automated submissions. (Grab my keys out of web.xml in the primefaces-string-input-2 project.)
4. Change the confirmation page so that you can click on either the username or the password and change it.
