

# Exercises:

## PrimeFaces Themes

1. Copy and rename your project from the exercises on panels. (If you did not do that set of exercises, then copy and rename my primefaces-panels-exercises project). Make the default theme le-frog. Remember that you need an extra JAR file for each theme other than aristo that you use. You can grab these JAR files from my primefaces-themes project rather than downloading them from the PrimeFaces Web site.

Deploy the project and look at each accordion panel section.

2. Add a Theme Switcher menu to the top of the project. Try changing the theme interactively.
3. Add a “Random Theme” button to the top of the project. Have it choose randomly between setting the theme to ui-lightness and setting it to ui-darkness.
