

# Exercises: Programmatic Security

- 1.** Make a JSP page that is accessible only to employees and executives. Display the username of the person accessing the page.
- 2.** Make a variation of the above page that also keeps track of the username of the previous person to access the page. Show the current username to everyone; show the name of the previous user only to executives. The simplest way to simulate two different users is to use two different browsers.
- 3.** Make a servlet that requires users to supply a non-empty username and password (any!) in order to access it. Have it simply display the username and password.
