

Apache Axis2: Clients

- 1.** Make a new Web Service Client. For the URL of the WSDL file, specify the URL from the last exercise on the previous set. (Make sure the previous project is running first.)
- 2.** Make code that can call `randomNumber1` and print out the result.
- 3.** Make code that can call `randomNumber2` and print out the result.
- 4.** Make a servlet that takes a form parameter representing a range, passes it to the `randomNumber2` service, then puts the result in the Web page. MVC would be a good choice here, but it is not necessary.
